

Response-Adaptive Randomization and Adaptive Combination Test for Clinical Trials with Limited Number of Patients: Practical Guide

#### S. Krasnozhon<sup>1</sup>, D. Schindler<sup>2</sup>, R.-D. Hilgers<sup>2</sup>, N. Heussen<sup>2</sup>, W.F. Rosenberger<sup>3</sup> and F. König<sup>1</sup> <sup>1</sup>Section for Medical Statistics/CeMSIIS, Medical University of Vienna, Wien, Austria, <sup>2</sup>Department of Medical Statistics, RWTH Aachen University, Aachen, Germany, <sup>3</sup>George Mason University, Fairfax, Virginia, USA

#### June 24 - 26, 2015, Cologne, Germany

This project has received funding from the European Union's Seventh Framework Programme for research, technological development and demonstration under grant agreement number FP HEALTH 2013-602552.

## Outline

#### 1 Introduction

- 2 Two-Arm Clinical Trials
- 3 Three-Arm 'Gold Standard' Non-Inferiority Clinical Trials with Binary Responses
- 4 Adaptive Design based on Adaptive Combination Test

#### 5 Conclusions

#### Aims

- investigate Response-Adaptive (RA) Randomization Procedures for Small Population Two-Arm Clinical Trials
  - Urn Models
  - Sequential Estimation Designs
- discuss extensions to Three-Arm 'Gold Standard' Non-Inferiority Trials
- scrutinise Adaptive Designs (AD) using adaptive combination tests and investigate influence of
  - the number and timing of interim analyses (IA)

4 Adaptive Design based on Adaptive Combination Test

#### 5 Conclusions

#### Conclusions

- minor changes in parameters may have a huge impact on performance (power, type I error, etc.);
- RA designs may not control the type I error rate;
- no "formal" proof of type I error control;
- extensive simulations are needed, but the question is, if simulations are sufficient to prove type I error control (Posch et al. [2011], Gutjahr et al. [2011]);
- by incorporating response-adaptive procedures into adaptive designs, we preserve type I error rate;
- in small populations, we should keep a number of IA to a minimum.

### Future Work

- Incorporate appropriate test procedures, that reflect the design.
- Investigate impact of timing, early stopping, etc.
- What are the main reasons (advantages) to use RA procedures in sequential designs?
- When, if so, does the randomization procedure need to be changed?
- How to compare procedures and what criteria to use?
